#### Adversarial Robustness Toolbox Lab

### Introduction

ART is a library developed by "IBM Research" which is dedicated to adversarial machine learning. Its purpose is to allow rapid crafting and analysis of attacks and defense methods for machine learning models. ART provides an implementation for many state-of-the-art methods for attacking and defending classifiers. See below links for more information on ART.

```

In this lab, you will work with the Adversarial Robustness Toolbox (ART) and implement an adversarial attack and its defense on a trained model. You will work with a model trained on the German Traffic Signs dataset (see Citation below) and get the model to misclassify a stop sign.

### **Dataset Citation**

J. Stallkamp, M. Schlipsing, J. Salmen, and C. Igel. The German Traffic Sign Recognition Benchmark: A multi-class classification competition. In Proceedings of the IEEE International Joint Conference on Neural Networks, pages 1453–1460. 2011.

@inproceedings{Stallkamp-IJCNN-2011,

```

```

## **Objectives**

}

Upon completing the lab, you will learn how to:

- 1. load a Tensorflow trained model
- 2. create an ART classifier object using the loaded model
- 3. perform an adversarial attack
- 4. perform a defense to make sure manipulated images can still be classified correctly

# **Lab Steps**

### **Step 1 - Create a Jupyter Notebook**

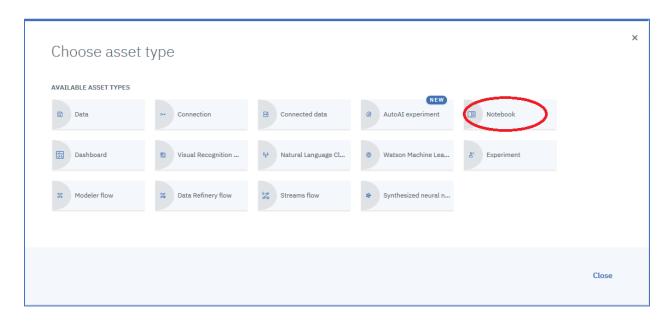

1. Click on the hamburger icon , then click on **Projects**, and then **Watson Studio Labs** (or whatever you named the project)

2. We are now going to create a notebook in our project. This notebook will be created from a url that points to the ART notebook in the github repository. Click the **Add to project** link.

3. Click on Notebook

4. Click on **From URL** under **New Notebook**, enter **ART Demo** for the **Name**, optionally enter a **Description**, leave the default for the **runtime**, and cut and paste the following url into the **Notebook URL** field.

https://github.com/bleonardb3/DS\_POT\_08-08/blob/master/Lab-8/ART%20Demo.ipynb

#### Click Create Notebook.

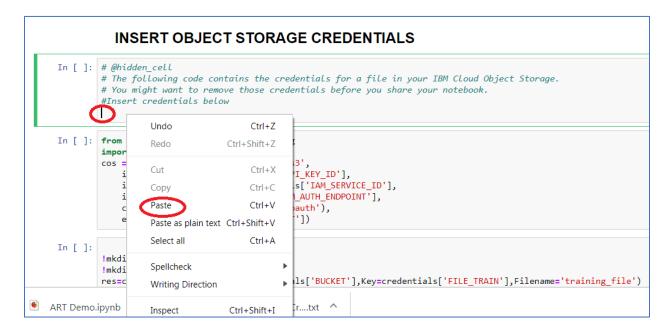

5. Before executing the notebook, you will need to insert object storage credentials into one of the cells in the notebook. Please click on the following link → Object Storage

Credentials to obtain your Object Storage Credentials. You should have an index card that provides your assigned object storage number. If not, ask your instructor. Locate the credentials that match your assigned object storage. Highlight the credentials and rightmouse click to get the pop-up menu. Click copy. (see below for Object Storage 1 example)

```
Object Store 1

credentials = {
    'TAM_SRNYICE_ID': 'iam—ServiceId=ef59066e-bf0f-473b-b739-882015cad058',
    'TBM_API_REY_ID': 'paAPYEjceTUCSIMYUZq3q1JGepyNYDNy—TChNzgpRkBT',
    'YNDF0INY': 'https://siam.us-geo.objectstorage.service.networklayer.com',
    'TBM_ADTH_ENDF0INT': 'https://iam.ng.bluemix.net/oidc/token',
    'YUKCET': 'watsonstudiolabs—donotdelete-pr-bfti4zlscllttp',
    'YILE_TRAIN': 'train.p',
    'YILE_TRAIN': 'vraiid.p',
    'YILE_SIGN': 'signnames.csv',
    'YILE_SIGN': 'signnames.csv',
    'YILE_SIGN': 'final.
    'MODEL_CHECRFOINT': 'Select All
    'MODEL_CHECRFOINT': 'Select All
    'YMOPL_CHECRFOINT': 'Select All
    'YILE_SIGN': 'YIND: 'YIND:
```

6. Scroll down in the notebook until you see **INSERT OBJECT STORAGE CREDENTIALS**. In the code cell below, place the cursor on a new line in the code cell underneath #**Insert credentials below**. Right-mouse click to get the pop-up menu and click **Paste** to paste the credentials.

7. The result should appear as below.

8. Scroll back to the top of the notebook and place the cursor in the first documentation cell.

9. Execute the code cells in the notebook. For those unfamiliar with Jupyter notebooks, read below.

A Jupyter notebook consists of a series of cells. These cells are of 2 types (1) documentation cells containing markdown, and (2) code cells (denoted by a bracket on the left of the cell) where you write Python code, R, or Scala code depending on the type of notebook. Code cells can be run by putting the cursor in the code cell and pressing **Shift>Enter>** on the keyboard. Alternatively, you can execute the cells by clicking on **Run icon** on the menu bar that will run the current cell (where the cursor is located) and then select the cell below. In this way, repeatedly clicking on **Run** executes all the cells in the notebook. When a code cell is executed the brackets on the left change to an asterisk '\*' to indicate the code cell is executing. When completed, a sequence number appears. The output, if any, is displayed below the code cell.
